The Hong Kong Baptist University

August 2013

Abstract

The determination of trace analytes in complex analytical matrices such as food and traditional Chinese medicines (TCMs), often requires an extensive sample preparation steps prior to instrumental analysis. These sample pretreatment steps include sampling, extraction, clean-up and pre-concentration. However, these steps are often time and solvent consuming, laborious and tedious. Recent evolution in sample pretreatment techniques focused on miniaturization in terms of sample size, solvent consumption and preparation time. More importantly, it aims to increase the extraction efficiency.

A diversity of research works in this thesis aim to facilitate the implementation of sample pretreatment methods for solid complex matrices such as food and TCMs. The innovations of the research works featuring a simplification with high-throughput sample preparation method, utilization of modified tools for extraction and a highly selective material with imprinted effects.

This thesis firstly describes a micro-scale extraction method, dispersive liquid-liquid microextraction (DLLME). A rapid, high throughput sample preparation method based on DLLME for simultaneous analysis of ten organophosphorus pesticides by gas chromatography-mass spectrometry (GC-MS) has accomplished a 100-fold enrichment with LOD down to sub-ppt levels based on 0.1g sample. The method has been fully validated in twelve commodities including fruits, vegetables and TCMs. A bi-functional ionic liquids (ILs) was used as a leachant and dispersive solvent in another DLLME study. An enrichment factor up to 450 was achieved by modifying a SPE cartridge pre-coated with ILs for multiple determinations of two different chemical groups, Sudan dyes and phthalate esters, from six oil-based paste and solid condiments. The pre-coated IL frits streamlined sample clean-up and extraction into a single step which shortens the extraction time into 6 min with low LOD in ppb levels. The third part of researches describe the design of molecularly imprinted polymer (MIP) in the selective extraction of cinnamic acid derived from TCMs. The strategic design involves a basic monomer, 4-vinylpyridine and cross-linker EGDMA. The MIPs showed a significant imprinting effect in application.

Table of Contents

Declaration.....	i
Abstract.....	ii
Acknowledgements.....	iii
Table of Contents.....	v
List of Tables.....	viii
List of Figures.....	ix
List of Abbreviations.....	xi
Chapter 1 Introduction.....	1
1.1 Evolution of sample preparation.....	1
1.2 Dispersive liquid-liquid microextraction (DLLME).....	4
1.2.1 Principles.....	4
1.2.2 New approaches of DLLME.....	7
1.2.2.1 Low-density organic solvents and collection devices.....	7
1.2.2.2 Ionic liquids.....	11
1.2.2.3 Disperser solvents.....	12
1.2.3 Combination with other extraction techniques.....	12
1.2.4 Applications of DLLME.....	12
1.3 Molecularly Imprinted Polymer (MIP).....	18
1.3.1 Principles.....	18
1.3.2 Synthesis.....	21
1.3.3 Characterization.....	22
1.3.4 Optimization.....	22
1.3.5 MIP applications.....	23
1.4 Food and TCMs matrices.....	26
1.5 Solid samples extraction techniques.....	26
1.6 Aims of this thesis work.....	28
1.7 References.....	29

Chapter 2 Highly sensitive and selective organophosphate screening in twelve commodities of fruits, vegetables and herbal medicines by dispersive liquid-liquid microextraction.....41

2.1	Introduction.....	41
2.2	Experimental.....	45
	2.2.1 Reagents and standards	45
	2.2.2 Apparatus and materials.....	45
	2.2.3 Sample preparation.....	48
	2.2.4 DLLME procedures.....	48
2.3	Results and discussion.....	49
	2.3.1 Method development.....	49
	2.3.2 Selection of extraction solvent.....	51
	2.3.3 Volume of extraction solvent.....	52
	2.3.4 Selection of dispersive solvent.....	53
	2.3.5 Volume of dispersive solvent.....	53
	2.3.6 Effect of salt.....	56
	2.3.7 Effect of extraction and centrifugation time for DLLME.....	56
	2.3.8 Method validation.....	59
2.4	Real sample analysis.....	64
2.5	Comparison of DLLME with other methods for OPPs analysis.....	66
2.6	Chapter summary.....	70
2.7	References.....	71

Chapter 3 Ionic liquid-based dispersive liquid-liquid microextraction for high throughput multiple food contaminants screening.....75

3.1	Introduction.....	75
3.2	Experimental.....	80
	3.2.1 Reagents and standards.....	80
	3.2.2 Apparatus and materials.....	81
	3.2.3 DLLME procedures.....	81
3.3	Results and discussion.....	83
	3.3.1 Selection of IL.....	84
	3.3.2 Volume of IL extractant.....	89
	3.3.3 Choice and volume used for dispersive solvent.....	91
	3.3.4 Effect of centrifugation time for DLLME.....	94
	3.3.5 Analytical performance.....	97

3.4	Real sample analysis.....	102
3.5	Comparison with other methods.....	104
3.6	Chapter summary.....	108
3.7	References.....	109

Chapter 4 Design of molecularly imprinted polymer for the selective extraction of cinnamic acid in complex analytical matrices...112

4.1	Introduction.....	112
	4.1.1 MIP applications to TCMs.....	114
4.2	Experimental.....	118
	4.2.1 Reagents and standards.....	118
	4.2.2 Apparatus and materials.....	118
	4.2.3 Preparation of MIP.....	118
	4.2.4 MISPE procedures.....	120
4.3	Results and discussion.....	121
	4.3.1 Monomer selection.....	122
	4.3.2 Optimization of template to monomer ratio.....	123
	4.3.3 Washing solvent.....	124
4.4	Chapter summary.....	125
4.5	References.....	126

Chapter 5 Conclusions.....129

5.1	Thesis summary.....	129
5.2	Future trends.....	130
