# Abstract

G-quadruplexes represent a versatile sensing platform for the construction of label-free molecular detection assays due to their diverse structures that can be selectively recognized by G-quadruplex-specific luminescent probes. In this thesis, we have explored the applications of the label-free G-quadruplex-based luminescent detection platforms for the detection of biomolecules and metal ions.

Chapter 1 provides an overview of the principles and recent developments of the field of luminescent oligonucleotide-based probes, and highlighting in particular the use of the “label-free” strategy for the construction of simple and inexpensive sensing platforms.

Chapter 2 introduces the basic experiments performed during the course of this thesis, including UV/Vis absorption spectroscopy, luminescence spectroscopy, nuclear magnetic resonance, mass spectrometry circular dichroism spectroscopy and G-quadruplex fluorescent intercalator displacement assay.

Chapter 3 describes a G-quadruplex-based switch-on luminescence assay for the detection of gene deletion using iridium(III) complex **1** as a G-quadruplex-selective probe. Our method is based on the formation of a split G-quadruplex upon hybridization of two critically designed quadruplex-forming sequences with the mutant DNA sequence, resulting in a “switch-on” luminescence response.

Chapter 4 describes a label-free, oligonucleotide-based, switch-on luminescence detection method for T4 polynucleotide kinase activity using a G-quadruplex-selective luminescent iridium(III) complex **2**. The application of the assay for screening potential T4 PNK inhibitors is also demonstrated. To our knowledge, this is the first metal-based assay for PNK activity that has been reported in the literature.

Chapter 5 describes a label-free oligonucleotide-based luminescence switch-on assay for the selective detection of sub-nanomolar  $\text{Pb}^{2+}$  ions in aqueous solution and real water samples. Iridium(III) complex **1** was employed as a G-quadruplex-specific luminescent probe and a guanine-rich DNA sequence (PS2.M, 5'-GTG<sub>3</sub>TAG<sub>3</sub>CG<sub>3</sub>T<sub>2</sub>G<sub>2</sub>-3') was employed as recognition unit for  $\text{Pb}^{2+}$  ions. The assay could detect  $\text{Pb}^{2+}$  ions in aqueous media with a limit of detection of 600 pM, and also exhibited good selectivity for  $\text{Pb}^{2+}$  ions over other heavy metal ions. Furthermore, the application of the assay for the detection of  $\text{Pb}^{2+}$  ions in spiked river water samples was demonstrated.

Chapter 6 describes a label-free G-quadruplex-based luminescent switch-on assay for the selective detection of micromolar histidine in aqueous solution. Iridium(III) complex **8** was employed as a G-quadruplex-specific luminescent probe while a guanine-rich oligonucleotide (Pu27, 5'-TG<sub>4</sub>AG<sub>3</sub>TG<sub>4</sub>AG<sub>3</sub>TG<sub>4</sub>A<sub>2</sub>G<sub>2</sub>-3')/cupric

ion ( $\text{Cu}^{2+}$ ) ensemble was employed as a recognition unit for histidine. The assay could detect down to 1  $\mu\text{M}$  of histidine in aqueous media, and also exhibited good selectivity for histidine over other amino acids with the use of the cysteine-masking agent *N*-ethylmaleimide. Furthermore, the application of the assay for the detection of histidine in diluted urine samples was demonstrated.

Chapter 7 summarizes the work that was conducted in this thesis, and the future outlook of G-quadruplex-based sensing is presented.

## Acknowledgements

I am very grateful to my two supervisors Dr. Edmond Ma Dik-Lung and Dr. Duncan Leung Chung-Hang (University of Macau) for providing me with the opportunity to be a member of Dr. Ma's research group. This thesis could not have been completed without their dedication, personal and professional guidance, and continuous encouragement throughout my graduate studies.

I am also grateful to the many staff members in the Chemistry department who lectured on fascinating topics within chemistry, including Prof. Chan Wing-Hong, Prof. Man-Shing Wong, Dr. Hung-Wing Li, Dr. Louis Man-Lay Leung and Dr. Suk-Yin Lai. I also wish to thank all the technicians in the Chemistry department for providing their technical support and Mr. Lo Kam Fai in graduate school for his kind help.

I would also like to thank all the group members of Dr. Ma's research group for all the great times we had together. To Ka-Ho Leung, Maria Kwan, Zheng Chen, Hui Yang, Wai-Chung Fu, Daniel Shiu-Hin Chan, Wai-Fung Lau, Lihua Lu, Modi Wang, Paul Lee, Sheng Lin, Bingyong He, Haijing Zhong and Lijuan Liu, you made my time at the department of chemistry of HKBU enjoyable and pleasant, and I thank you all for your help and support during my studies.

I am also very thankful to Prof. Jean-Louis Mergny, Dr. Jun Zhou, Dr. Anne

Bourdoncle, Gilmar Salgado and Samir Amrane at the Institut Européen de Chimie et Biologie, France for their friendship, encouragement, and help.

Lastly, I am also grateful to my mother for her endless love and support, and my sisters, brother, brother in-law and sister in-law for their financial support and love.
