Abstract

Lutein as a naturally occurring pigment has been widely applied in food industry due to its safety as well as properties beneficial to human health. At present the production of lutein from plant sources, such as marigold, is however limited by planting area, weather and high manpower costs. In contrast, green alga *Chlorella pyrenoidosa* (*C. pyrenoidosa*) which also contains lutein can survive under heterotrophic conditions has been regarded as an alternative producer of lutein due to its potential for large-scale industrial production in stainless-steel fermentors. The lutein content in *C. pyrenoidosa* under heterotrophic conditions however, is very low and decreases gradually with the elongation of culture time and the loss of light stimulation. In this study I investigated the characteristics of lutein biosynthesis and its relationship with chlorophyll biosynthesis *C. pyrenoidosa* grown in the dark. Moreover, I studied also the preliminary mechanism for the retrograde regulation of lutein biosynthesis by mitochondria under heterotrophic conditions. In addition, I also experimented with different ways to enhance lutein production in *C. pyrenoidosa* grown in the dark.

My results showed that glucose assimilation favored the cell biomass production, but not cellular lutein accumulation. Up-regulated lipid production induced by nitrogen deficiency was possibly the real reason for the glucose bleaching. The biosynthesis of lutein and chlorophyll was not strictly synchronized in *C. pyrenoidosa* under heterotrophic conditions. The proteomic analysis showed that chlorophyll deficiency had a great influence on the abundance of minor antenna protein CP26, CP29 in the chloroplast of *C. pyrenoidosa*. The major antenna protein LhcbM3 of light-harvesting complex II is likely to have a close relationship with the accumulation of lutein and was not

greatly influenced by the presence of chlorophyll.

I further investigated the effect of some metabolic stimulators and intermediates on lutein production in *C. pyrenoidosa* grown in the dark. Vitamin A showed profound effect in stimulating lutein biosynthesis, with an increase of 70.9% of lutein content when 4 mM vitamin A was added at the beginning of the cultivation. β -carotene and zeaxanthin were also found to have positive effect on lutein accumulation, lutein content increased by 27.1% and 19.8% respectively with the addition of 0.05 mg/mL of zeaxanthin and β -carotene into the medium.

In addition, I also investigated the influence of different types of abiotic stress on lutein biosynthesis in *C. pyrenoidosa*. It was found that externally-introduced oxidative stress couldn't stimulate the lutein production in *C. pyrenoidosa* grown in the dark, but improved the lutein accumulation in photoautotrophically cultivated algal cells. In addition, cold stress showed significant effect on stimulating lutein production in mutant 15-2, a chlorophyll deficient *C. pyrenoidosa*, under heterotrophic conditions.

Finally, the role of mitochondrial respiratory electron transport chain (mRET) in retrograde regulation of lutein, chlorophyll biosynthesis and chloroplast development in *C. pyrenoidosa* grown in the dark was also investigated through mitochondrial dysfunction and proteomic analysis. My results showed that inhibition of alternative oxidase of mRET significantly enhanced lutein and chlorophyll biosyntheses in *C. pyrenoidosa* grown in the dark. The proteomic study indicated that mRET could indeed retrograde regulate the expression of chloroplast proteins, such as key enzymes involved in lutein and chlorophyll biosyntheses pathways.

Table of Contents

Declaration.....	i
Abstract.....	ii
Acknowledgements.....	iv
Table of Content.....	v
List of Tables.....	xi
List of Figures.....	xii
List of Abbreviations.....	xvii
Chapter 1. Literature review and research objectives	1
1.1. Introduction of lutein	1
1.1.1. Lutein structure	1
1.1.2. Properties of lutein.....	2
1.1.3. Sources of lutein	5
1.2. Biosynthesis of lutein.....	6
1.2.1. Taxonomic characteristics of <i>Chlorella pyrenoidosa</i>	6
1.2.2. Cultivation mode of green alga.....	6
1.2.3. Lutein biosynthetic pathway	8
1.3. Regulation of carotenogenesis in plant, green alga	12
1.3.1. Intercommunication of cellular organelles and retrograde regulation of photosynthetic genes expression	12
1.3.2. Stimulation of carotenogenesis by oxidative stress	16
1.4. Research objectives.....	19
Chapter 2. Influence of carbon and nitrogen sources on pigment biosynthesis and synchronism between lutein and chlorophyll biosyntheses in the green microalga <i>Chlorella pyrenoidosa</i>	21

2.1. Introduction.....	22
2.2. Materials and methods	23
2.2.1. Microalga and culture conditions	23
2.2.2. Cell growth and pigments analyses	24
2.2.3. Glucose concentration determination	25
2.2.4. Cell composition measurement.....	25
2.2.5. Transmission electronic microscope experiment.....	26
2.2.6. Statistical analysis	26
2.3. Results.....	27
2.3.1. Time course experiment of <i>C. pyrenoidosa</i> cultivated in low nitrogen medium	27
2.3.2. Time course experiment of <i>C. pyrenoidosa</i> cultivated in high nitrogen medium	31
2.3.3. Relationship between chlorophyll and lutein biosyntheses in <i>C.</i> <i>pyrenoidosa</i> under heterotrophic conditions.....	33
2.4. Discussion.....	35
Chapter 3. Chloroplast proteins in <i>Chlorella pyrenoidosa</i> and its mutants under heterotrophic conditions.....	39
3.1. Introduction.....	40
3.2. Materials and methods	42
3.2.1. Microalga and the establishment of mutants	42
3.2.2. Pigment determination	42
3.2.3. Chloroplast protein extraction	42
3.2.4. One dimensional SDS gel electrophoresis.....	44
3.2.5. Two-dimensional gel electrophoresis (2-DE)	44

3.2.6. Gel silver-staining	45
3.2.7. In-gel trypsin digestion	46
3.2.8. MALDI TOF/TOF mass spectrometry and protein identification	46
3.2.9. Protein categorization and bioinformatic analysis	47
3.3. Results	48
3.3.1. Differences in pigment profiles between mutant and wild type <i>C. pyrenoidosa</i>	48
3.3.2. SDS-PAGE of chloroplast protein in wild type <i>C. pyrenoidosa</i> and mutants	49
3.3.3. Analysis of chloroplast proteome profiling	50
3.3.4. Protein identification and functional categorization	53
3.3.5. Down-regulated proteins in mutants	67
3.3.6. Up-regulated proteins in mutants	70
3.3.7. Up-regulated proteins in mutant 15-2 against mutant 50-3	71
3.4. Discussion	71
Chapter 4. Effect of metabolic stimulators and intermediates on lutein biosynthesis and production in the green alga <i>Chlorella pyrenoidosa</i> under heterotrophic conditions	75
4.1. Introduction	76
4.2. Materials and methods	77
4.2.1. Microalga and culture conditions	77
4.2.2. Cell growth and pigments analyses	77
4.2.3. Statistical analysis	77
4.3. Results and discussion	78
4.3.1. Effect of vitamin A on cell growth and lutein biosynthesis	78

4.3.2. Effect of organic acid on cell growth and lutein production.....	82
4.3.3. Effect of amino acids on cell growth and lutein biosynthesis	85
4.3.4. Effect of intermediates of carotenoid metabolism on lutein biosynthesis.....	86
Chapter 5. Effect of abiotic stress on lutein biosynthesis in <i>Chlorella pyrenoidosa</i>.....	90
5.1. Introduction.....	91
5.2. Materials and methods	92
5.2.1. Microalga and culture conditions	92
5.2.2. Cold stress treatment.....	93
5.2.3. Cell population counting, protein and lipid analyses.....	93
5.2.4. Cell growth and pigments analyses	93
5.2.5. Statistical analysis	93
5.3. Results and discussion	94
5.3.1. Oxidative stress caused by H ₂ O ₂ and NaClO	94
5.3.2. Oxidative stress triggered by methyl jasmonate	96
5.3.3. Oxidative stress elicited by AAPH	98
5.3.4. Oxidative stress triggered by salicylic acid	100
5.3.5. Oxidative stress caused by mercaptosuccinic acid	102
5.3.6. Treatment with inhibitors of antioxidant enzymes combined with ROS generator.....	104
5.3.7. Salicylic acid treatment of <i>C. pyrenoidosa</i> under mixotrophic and autotrophic conditions.....	106
5.3.8. Effect of cold stress on lutein biosynthesis.....	114
Chapter 6. Proteomic approach to study the role of mitochondria in	

regulating lutein and chlorophyll biosyntheses in <i>Chlorella pyrenoidosa</i> under heterotrophic conditions.....	123
6.1. Introduction.....	125
6.2. Materials and methods	126
6.2.1. Microalga and culture conditions	126
6.2.2. Mitochondrial dysfunction.....	126
6.2.3. Pigments analysis.....	127
6.2.4. Redox and energy states evaluation	127
6.2.5. Extraction of water-soluble proteins	128
6.2.6. One dimensional SDS gel electrophoresis	129
6.2.7. Two-dimensional electrophoresis	130
6.2.8. Gel silver-staining and image analysis	130
6.2.9. In-gel trypsin digestion	130
6.2.10. Mass spectrometry and protein identification.....	131
6.2.11. Protein categorization	132
6.3. Results.....	132
6.3.1. Variation of lutein and chlorophyll biosyntheses.....	132
6.3.2. Analysis of redox and energy states.....	134
6.3.3. SDS-PAGE of total water-soluble proteins.....	137
6.3.4. Proteome profiling analysis	138
6.3.5. Protein identification and functional categorization.....	141
6.4. Discussion	156
6.4.1. Up-regulation of antioxidant proteins.....	158
6.4.2. Variation of chloroplast proteins expression after mitochondrial dysfunction.....	160

6.4.3. Variation of transcription and protein fate related proteins expression	163
6.4.4. Variation of metabolism and energy related proteins expression	166
Chapter 7. Summary and future perspectives	168
7.1. Summary	168
7.2. Recommendation for future work	171
References	174
Curriculum Vitae	205
