Abstract

This thesis mainly consists of two parts. The first part focuses on exploring the growth of silver (Ag) dendrite crystals. The fast growth synthesis of Ag dendrite crystals on a copper (Cu) substrate assisted by sulfate (SO_4^{2-}) ions based on an electroless galvanic displacement reaction between solid Cu and Ag^+ ion is presented. The growth of Ag dendrites is succeeded by using an aqueous solution of Ag^+ ion and a Cu foil. Interestingly, the morphology, apparent color, and growth rate of Ag dendrites on Cu foil using 2.5 mM Ag_2SO_4 aqueous solution are different from that of 5.0 mM AgNO_3 aqueous solution even though they contain the same concentration of Ag^+ ion. The growth rate of Ag dendrites is proved to be much accelerated for a solution of Ag^+ ions with SO_4^{2-} . The diffusion-limited growth and oriented attachment explain the formation of the Ag dendrites under the non-equilibrium growth conditions. The effect of SO_4^{2-} ion on the growth of Ag dendrites on Cu foil has been investigated in detail. In addition, Liesegang rings (LR) of various types of Ag dendrite crystals are observed from an aqueous solution based on a simple galvanic displacement reaction between Zn plate and Ag_2SO_4 . The formation of LR of Ag dendrite crystals is attributed to the concentration gradient and diffusion of Ag^+ ions in aqueous solution. The entire growth process and formation mechanism of LR of Ag dendrites are investigated in detail. The growth process of Ag dendrites can be readily observed under a microscope. The resultant Ag dendrites are characterized by scanning electron microscopy, transmission electron microscopy, X-ray powder diffraction, energy dispersive X-ray spectroscopy, and X-ray photoelectron spectroscopy. Finally, the synthesized Ag dendrites have been successfully employed as a Raman probe for

surface-enhanced Raman spectroscopic (SERS) analysis of melamine. The SERS results demonstrate that Ag dendrites can be a useful solid substrate for SERS analysis.

The second part is to separate, analyze and characterize polydisperse water-soluble gold nanoclusters (AuNCs) stabilized with *N,N'*-dimethylformamide (DMF) by reverse-phase high-performance liquid chromatography (RP-HPLC) in conjunction with photodiode array (PDA) detector and fluorescence detector. Under optimal elution gradient condition, the separation of DMF-AuNCs is monitored by absorption and fluorescence spectroscopy. The UV-vis spectral characteristics of the separated DMF-AuNCs have been captured and do not possess distinct surface plasmon resonance band, indicating that all DMF-AuNCs are small AuNCs. The photoluminescence emission spectra of the separated DMF-AuNCs are in the blue-light region. Moreover, cationic DMF-AuNCs are identified by ion chromatography. Our proposed RP-HPLC methodology has been successfully applied to separate AuNCs of various Au atoms as well as DMF-stabilized ligands. Finally, the composition of the separated DMF-AuNCs is confirmed by mass spectrometry, proving that the as-synthesized DMF-AuNCs product consists of Au_{10}^+ , Au_{10} , Au_{11} , Au_{12} , Au_{13} , and Au_{14} NCs stabilized with various numbers of DMF ligands. In addition, the growth of individual DMF-AuNCs in polydisperse AuNC samples using similar RP-HPLC methodology. Their growths at various reaction times are offline monitored by HPLC-PDA. The DMF-AuNC reaction products are effectively separated into different elution peaks, indicating that various kinds of AuNC species are formed on the course of the synthesis reaction. Finally, the chemical compositions of the separated DMF-AuNCs are confirmed by matrix-assisted laser desorption/ionization time-of-flight

mass spectrometry, showing that ultras-small NCs including Au₈, Au₁₀⁺, Au₁₂, and Au₁₃-protected with various numbers of DMF ligand are simultaneously generated over the course of the reaction. The Au₁₃(DMF)₉ is unstable in the dry state since it vanishes after the excess DMF has been removed. Our established HPLC methodology provides a viable approach to study the growth of various AuNCs species over the course of the reaction.

Table of Contents

Declaration.....	i
Abstract.....	ii
Acknowledgements.....	v
List of Tables, Scheme and Figures.....	xi
List of Abbreviations	xviii
Chapter 1 Introduction.....	1
1.1 Silver Dendrites	1
1.2 Preparation Methods of Ag Dendrites	3
1.2.1 Electrochemical Deposition.....	3
1.2.2 Hydrothermal or Solvothermal Synthesis	6
1.2.3 Organic Reductant Reaction.....	7
1.2.4 Galvanic Displacement Reaction	9
1.2.5 Other Synthetic Methods.....	12
1.3 Applications of Ag Dendrites.....	13
1.3.1 Surface-Enhanced Raman Scattering	13
1.3.2 Biosensor	15
1.3.3 Catalysis	16
1.3.4 Superhydrophobic Surface	17
1.4 Liesegang Rings	19
1.5 Gold Nanoclusters	20

1.6	Separation Techniques for Gold Nanoclusters	23
1.6.1	Capillary Electrophoresis	23
1.6.2	Gel Electrophoresis	24
1.6.3	Liquid Chromatography	26
1.6.4	Other Separation Techniques	28
1.7	Aims of Project.....	29
Chapter 2	Experimental Section	33
2.1	Chemicals	33
2.2	Synthesis of Ag Dendrites	34
2.3	Synthesis of Liesegang Rings of Ag Dendrite Crystals	34
2.4	Synthesis of DMF-Protected Gold Nanoclusters	35
2.5	Characterization Methods.....	35
2.5.2	XPS Measurement	36
2.5.3	SEM and EDS Measurement.....	36
2.5.4	TEM/HRTEM Measurement.....	36
2.5.5	Raman Spectra Measurement	37
2.5.6	Video Capture.....	37
2.5.7	UV-Visible Absorption and Photoluminescence Spectroscopy	37
2.5.8	Mass Spectrometry	38
2.6	Analytical Separation	39
2.6.1	High-Performance Liquid Chromatography.....	39
2.6.2	Ion Chromatography.....	40
Chapter 3	Fast Growth Synthesis of Ag Dendrite Crystals Assisted by Sulfate Ion and Its Application for Surface-Enhanced Raman Scattering	41

3.1	Introduction	41
3.2	Results and Discussion	42
3.2.1	Structure and Morphology of Dendritic Ag Crystals	42
3.2.2	Effect of Ag ₂ SO ₄ Concentration and Reaction Time on the Growth of Ag Dendrites.....	47
3.2.3	Effect of Nitrate on the Growth of Ag Dendrites	51
3.2.4	Effect of Sulfate on the Growth of Ag Dendrites.....	53
3.2.5	Growth Mechanism	57
3.2.6	SERS of Melamine	64
3.3	Conclusion.....	66
Chapter 4 Liesegang Rings of Dendritic Silver Crystals Emerging from Galvanic Displacement Reaction in Liquid-Phase Solution		
		67
4.1	Introduction	67
4.2	Results and Discussion	68
4.2.1	Characterization of LR of Ag Dendrites	68
4.2.2	Growth Process and Formation Mechanism of LR of Dendritic Ag Crystals.....	72
4.2.3	Raman spectroscopy	88
4.3	Conclusion.....	90
Chapter 5 High-Performance Liquid Chromatographic Analysis of As-Synthesized <i>N,N'</i> -Dimethylformamide-Stabilized Gold Nanoclusters Product...91		
5.1	Introduction	91
5.2	Results and Discussion	94
5.2.1	Spectroscopic Measurement of DMF-AuNCs.....	94

5.2.2	Effect of MeOH on HPLC Separation.....	96
5.2.3	Gradient Elution of DMF-AuNCs.....	98
5.2.4	Ion Chromatographic Separation of Charged DMF-AuNCs.....	107
5.2.5	Mass Spectrometric Analysis of DMF-AuNCs.....	109
5.3	Conclusion.....	119
Chapter 6 Investigation of the Growth of <i>N,N'</i> -Dimethylformamide-Protected Gold Nanoclusters by High-Performance Liquid Chromatography.....		
		120
6.1	Introduction.....	120
6.2	Results and Discussion.....	122
6.2.1	Spectroscopic Measurement of DMF-AuNCs in DMF solution.....	122
6.2.2	HPLC Analysis of DMF-AuNCs at Different Reaction Times.....	123
6.2.3	Ion Chromatographic Analysis of Growth of Charged DMF-AuNCs	135
6.2.4	MALDI-TOF MS Analysis of DMF-AuNCs.....	137
6.3	Conclusion.....	142
Chapter 7 Conclusion Remarks and Future Work.....
