# Gametogenesis and Flower Development Controlled by AtAnamorsin1 and AtPUB4

# **YU Boying**

# A thesis submitted in partial fulfilment of the requirements for the degree of Doctor of Physiology

Principal Supervisor: Prof. XIA Yiji

Hong Kong Baptist University

January 2015

**Declaration** 

I hereby declare that this thesis represents my own work which has been done

after registration for the degree of Ph.D at Hong Kong Baptist University, and has

not been previously included in a thesis, dissertation submitted to this or other

institution for a degree, diploma or other qualification.

### **Abstract**

Flowers are the organs for sexual reproduction in angiosperms. Gametogenesis in floral organs leads to formation of sperms and eggs and their fertilization forms a zygote that develops into a new plant. Gametogenesis and embryogenesis involve precisely regulated biological processes controlled by complex networks of genes and pathways.

In this study, AtANA1, which was identified as a redox sensitive protein in previous study, was found to be essential for embryogenesis and also plays an important role in both male and female gametogenesis. Without a functional AtANA1, embryo development is arrested after the first cell division of the zygote. The anal mutation also causes arrest in different steps of male and female gametogenesis. Aborting pollen and embryos caused by the anal mutation exhibit enhanced accumulation of reactive oxygen species and DNA fragmentation, marks of programmed cell death. Presence of aborting *anal* pollen was also found to lead to abortion of wild type pollen in the same anther, raising a possibility that the aborting anal pollen might release a death signal. ANA1 could be involved in an oxidative stress signaling pathway, and loss of its function triggers death of gametophytic and embryonic cells.

Another important protein involved in Arabidopsis reproductive processes is PUB4, an E3 ubiquitin ligase. The *pub4* mutation was previously found to cause abnormal enlargement of tapetal cells and incomplete degeneration of the tapetum layer, resulting in a defect in pollen release and conditional male sterility. In this study, we characterized PUB4's role in controlling floral meristem determinacy. The *pub4* mutation causes formation of ectopic floral organs inside of carpels/siliques. It was found that the *pub4* mutation leads to ectopic expression of *WUSCHEL*, an important regulator which is essential for maintaining shoot apical meristem and floral meristem, which could be responsible for the flower-in-flower phenotype. PUB4 appears to work additively with AGAMOUS (AG) to control appropriate expression of the *WUS* gene. Three extra large G proteins (XLGs) in *Arabidopsis*, which interact with PUB4, also play roles in controlling tapetal cell enlargement and degeneration. However, XLGs might not function in floral meristem determinacy.

## **Acknowledgements**

Foremost, I would like to show my sincere gratitude to my principal supervisor, Prof Xia Yiji, for his fully support, every enlightened suggestion, and encouragement during my study period. Without his guidance, his patience, and his immense knowledge, I would never have finished my study and completed this thesis. I could not imagine a better mentor for my Ph.D study.

I also want to thank Dr. QIU Jianwen, and Prof. ZHANG Jianhua for their precious comments and constant help in these years.

I am also grateful to my laboratory technician, Ms. Louise Ng Lai Ha, for her technical supports, experiment materials and chemicals ordering. Besides, I also want to show my thanks to technicians of our department, Mr. Ip Wang Kwong, and Mr. Chung Wai Shing, for teaching me detail research skills. I want to thank the secretary of our department, Ms Lau Pui Ling, and executive assistant in graduate school, Mr. K.F. Lo, for their generous help every time.

In addition, my great thanks goes to our lab members: Yin Zhao, Liu Pei, Wang Yipin, Wu Yingying, Jiang Tiantian, Yu peipei, Li yimim, Zhang Hailei for their help, for the friendship, for their company through the past four years.

Last not but least, I would like to express my thanks to my family members for their spiritually support and encouragements during my whole study period.

## **Table of Contents**

Declaration	i
Abstract	ii
Acknowledgements	iii
Table of Contents	iv
List of the Tables	ix
List of the Figures	X
List of Abbreviation	xii
Chapter One - Literature Review	1
1.1 The Shoot Apical Meristem	1
1.1.1 Introduction to the shoot apical meristem	1
1.1.2 Signaling pathways in the SAM	1
1.2 Flowering and flower determinacy	4
1.2.2 Transition of vegetative to reproductive development	4
1.2.2 Floral meristem	5
1.2.3 ABC model in FM identity	6
1.2.4 Termination of floral meristem	8
1.3 Male and Female gametogenesis	9

1.3.1 Stamen development and male gametogenesis	9
1.3.2 Genes involved in male gametophyte development	11
1.3.3 Formation of gynoecia and female gametogenesis	13
1.3.4 Genes involved in ovule development	14
1.3.5 Mutations affecting both male and female gametogenesis	18
1.4 Embryogenesis	20
1.4.1 Introduction to embryogenesis	20
1.4.2 Genes involved in embryogenesis	22
1.5 Program cell death	24
1.5.1 Program cell death in plants	24
1.5.2 Program cell death in biological progresses	25
1.5.3 Reactive oxygen species regulate program cell death	27
1.6 Summary and perspectives in this study	28
Chapter Two- Materials and Methods	29
2.1 Plant materials	29
2.2 Plant growth condition	29
2.3 PCR analysis and T-insertion lines	30
2.4 Constructing vectors	30

2.5 Bacterial strains and plasmids	31
2.6 Oligonucleotide primers	33
2.7 Polymerase chain reaction (PCR), restriction enzyme digestion on plasm	nid,
product purification and ligation	35
2.8 Preparation of Agrobaceterium tumefaciens competent cells and Arabido	opsis
transformation	36
2.9 Transgenic lines selection and analysis	37
2.10 Extraction and purification of genomic DNA	38
2.11 Extraction of plant total RNA and cDNA synthesis	39
2.12 Real-time quantitative PCR analysis	40
2.13 β-Glucuronidase (GUS) histochemical assays	40
2.14 Wax sectioning and resin sectioning	41
2.15 Terminal Deoxynucleotidyl Transferase dUTP Nick End Labelling assa	ay
(TUNEL)	42
2.16 Light microscope observation and confocal microscope observation	43
2.17 Protein expression, purification and in vitro ubiquitination assay	44
Chapter Three-AtANA1 is Required for Gametogenesis and Embryoge	nesis
	46
3.1 Introduction	46

3.2 Results	50
3.2.1 Loss-of-function mutation of <i>Atana1</i> leads to embryonic lethality	50
3.2.2 AtANA1 disruption blocks embryogenesis	54
3.2.3 AtANA1 Disruption causes abortion of some ana1 pollen and also	
affect neighbouring wild type pollen	57
3.2.4 Disruption of <i>ANA1</i> causes abortion of male gametophytes before PMI	
	63
3.2.5 The <i>Atana1</i> mutation arrests female gametogenesis during mitosis	65
3.2.6 The mutation in <i>ANA1</i> leads to programmed cell death of developing	
seeds and pollen grains	68
3.2.7 The phenotypes associated with the ana1 mutation can be complemented	l by
the AtANA1 gene	72
3.2.8 The <i>ana1-2</i> mutation does not affect male gametogenesis	72
3.2.9 Expression patterns of <i>AtANA1</i>	76
3.2.10 AtANA1 protein is localized at cytosol	76
Chapter Four- AtPUB4 Controls Floral Determinacy	79
4.1 Introduction	79
4.2 Results	83
4.2.1 PUB4 regulates floral meristem determinacy	83

4.2.2 Does auxin plays a role in the PUB4-mediated floral meristem
determinacy?
4.2.3 <i>AtPUB4</i> is involved in controlling pathways of floral stem cells maintenance.
91
4.2.4 The <i>pub4</i> mutation causes ectopic expression of <i>WUSCHEL</i> in siliques94
4.2.5 AtPUB4 and AG act additively in controlling floral meristem determinacy 96
4.2.6 PUB4 has E3 ligase activity
4.2.7 AtXLGs, which interact with PUB4, are also involved in regulating growth
and degeneration of tapetal cells
Chapter five-Conclusion and Discussion105
5.1 AtANA1 is required in gametogenesis and embryogenesis
5.2 AtPUB4 regulates floral determinacy as well as development of tapetal cells.
