Abstract

Finite element method is the most important numerical technique for partial differential equations. This thesis is mainly concerned with the application of finite element method to the elliptic problems with interfaces, the Stokes equations with corner singularities and the one- and two-dimensional time-dependent Schrödinger equations on unbounded domains.

For problems with singular solutions, the standard finite element method is difficult to give satisfactory numerical results due to the presence of the singularities. In order to increase the accuracy of numerical solutions, several improved methods have been proposed, which includes "local mesh refinement method", "singular point separation method" and "singular finite element method".

One of the main contribution of the thesis is to develop the singular finite element method by eliminating the requirement for the analytical singular expansion form of the exact solution. We firstly obtain a discrete singular expansion near singular point by solving a simple eigenvalue problem, which is one dimension less than the original problem, and then use the approximation of the singularity together with the standard finite element basis functions to construct the singular finite element space. Finally, we find the singular finite element solution on a conventional mesh. Our method has been successfully applied to our concerned problems in the thesis. Numerical examples show that this method is very effective.

Another main contribution of the thesis is to apply finite element method successfully to the one- and two-dimensional time-dependent Schrödinger equations on unbounded domains. So far, there has been a lot of work on the numerical approximation of the above problem by finite difference method. But to our knowledge, the application of finite element method to this problem has been much less studied. Particularly, no theoretical analysis of finite element approximation has been discussed. In the thesis, we firstly reduce original problem into an initial-boundary value problem on a bounded domain by introducing a exact artificial boundary condition, and then fully discretize this reduced problem by applying Crank-Nicolson scheme in time and linear or quadratic finite element approximation in space. This scheme has proved to be unconditionally stable and convergent. Numerical examples have verified our theoretical results.

Table of Contents

Declaration	i
Abstract	ii
Acknowledgements	iii
Table of Contents	iv
List of Figures	vi
List of Tables	vii
Chapter 1 Introduction	1
Chapter 2 The Singular Finite Element Method for Some Elliptic Boundary Value Problem with Interfaces	6
2.1 Introduction	6
2.2 The Approximation of the Singularity	9
2.3 The Singular Finite Element Approximation	18
2.4 Numerical Examples	23
Chapter 3 A Finite Element Method for Stokes Equation Using Dis- crete Singularity Expansion	29
3.1 Introduction	29
3.2 The Approximation of the Singularity	30
3.3 The Finite Element Approximation	41
3.4 Numerical Examples	43

Chapter 4	Analysis of Finite Element Method for One-Dimensional Time-Dependent Schrödinger Equation on Unbounded Domain	53
4.1	Introduction	53
4.2	Construction of Fully Discrete Finite Element Scheme	56
4.3	Analysis of the Fully Discrete Scheme	59
4.4	Numerical Example	70
Chapter 5	Analysis of Finite Element Method for Two-Dimensional Time-Dependent Schrödinger Equation on Unbounded Domain	73
5.1	Introduction	73
5.2	Construction of Fully Discrete Finite Element Scheme	76
5.3	Analysis of the Fully Discrete Scheme	81
5.4	Numerical Example	90
Chapter 6	Conclusions and Further Work	94
	Bibliography	96
	Curriculum Vitae	102
