**Tyrosine Hydroxylase-Green Fluorescence Protein Transgenic
Zebrafish as A Biosensor and Animal Model
for Nicotine and Ketamine Drug Effects**

August 2012

Abstract

Zebrafish has become a common vertebrate model for study of neurogenesis and neurodevelopment. The transparent rapid development and more close relationship to humans than invertebrate models were the leading reasons for using them in neurological research. Recently, zebrafish has been employed as model to study neurological disorders of addictive drugs by analyzing behavior, morphological and neuroregulatory systems. Taking the advantage of transparent body, transfection of green fluorescent protein (GFP) in zebrafish is developed and widely used to label endogenous protein, cells, organs or even organelles.

In the present study, green fluorescent plasmid constructs were produced containing the promoter of tyrosine hydroxylase (TH; a key synthetic enzyme for catecholamines) and GFP. The constructs were microinjected into zebrafish embryonic cells during the one-cell stage. At 3 days post-fertilization (dpf), GFP started to express in olfactory bulb (OB), telencephalon (Tel), posterior tuberculum (TPp), pretectal area (PPv) and periventricular hypothalamus (PTN) of zebrafish. The present results were confirmed by TH immunohistochemical staining and 6-hydroxydopamine (6-OHDA) challenge in the zebrafish with the same developmental stages. This transgenic fish model provided a novel drug response model which can also be used for studying neurological disorders relating to catecholamines in the nervous system.

Nicotine and ketamine used as a drug in present study to alter intrinsic TH level in zebrafish brain. They had different pharmacological mechanisms that inducing stimulative effects by binding to distinct receptor which further activating the synthesis and release of dopamine. First, locomotion assay was examined to study the general excitatory effects of nicotine and ketamine. Locomotion activities were markedly elevated in a wide range of nicotine concentrations and low doses of ketamine treatment. Since increased locomotion activity was due to activation of dopamine release and excitatory synaptic transmission, it implied that TH level was elevated followed by increase of locomotion activity. Second, TH protein level was assessed in Western blot analysis. Same as the above results, TH protein levels were significantly increased followed by a rising concentrations of nicotine and low doses of ketamine treatments. Finally, TH expression was examined in prior established transgenic zebrafish model. Surprisingly, the trend of TH induction was similar to the results in western blotting.

Based on the parallel results in drug response, TH-GFP transgenic zebrafish model is reliable and useful for expressing intrinsic TH level in a more effective way. The effective transgenic model prevents abundant processes in other experimental assays. TH-GFP transgenic zebrafish, as a novel high throughput sensing model, is highly recommended to be used in drug testing.

Table of contents

Declartion	i
Abstract	ii
Acknowledgement	iv
Table of Contents	v
List of Figures	x
List of Abbreviation	xiii
 Chapter 1 Literature review	 1
1.1 Zebrafish	1
1.1.1 Introduction	1
1.1.2 Dopamine	2
1.1.3 Tyrosine hydroxylase (TH)	3
1.1.4 Distribution of TH in zebrafish	4
1.1.5 6-hydroxydopamine (6-OHDA)	6
1.2 Nicotine	8
1.2.1 Introduction	8
1.2.2 Structure and Functions	9
1.2.2.1 Structure	9
1.2.2.2 Clinical usages	10
1.2.2.2.1 Nicotine dependence drug	10
1.2.2.2.2 Antipsychotic drug	10
1.2.2.3 Physical usage	11
1.2.2.3.1 Stimulative drug	11
1.2.3 Pharmacological mechanism	11
1.2.3.1 A nicotinic acetylcholine (nACh) receptor antagonist	11
1.2.4 Nicotine effects in humans	13
1.2.5 Nicotine effects in animals	14
1.3 Ketamine	16
1.3.1 Introduction	16
1.3.2 Structure and Functions	17
1.3.2.1 Structure	17
1.3.2.2 Clinical usages	18
1.3.2.2.1 Anesthetic drug	18
1.3.2.2.2 Anti-depression drug	18

1.3.2.2.3 Anti-addiction drug	19
1.3.2.3 Illicit abuse	19
1.3.3 Pharmacological mechanism	20
1.3.3.1 A non-competitive NMDA receptor antagonist	20
1.3.3.2 Other receptors agonist	21
1.3.3.3 Other receptors anatagoinst	21
1.3.4 Ketamine effects in humans	22
1.3.5 Ketamine effects in animals	23
1.4 Objectives of the thesis	25
1.4.1 Production of TH-GFP transgenic zebrafish	25
1.4.2 Acute nicotine treatment in larval zebrafish	25
1.4.3 Acute ketamine treatment in larval zebrafish	26
Chapter 2 Methodology and materials	27
2.1 Animal care and maintenance	27
2.2 Primers design of TH sequence	27
2.3 Polymerase chain reaction (PCR) assay	28
2.4 Electrophoresis	29
2.5 Sequencing	29
2.6 Preparation of plasmid DNA	29
2.7 Bacterial culture	30
2.8 Microinjection	31
2.9 Whole-mount antibody immunofluorescence	32
2.9.1 Single immunofluorescence	32
2.9.2 Double immunofluorescence	33
2.10 6-OHDA treatment	34
2.11 Nicotine and ketamine treatment	34
2.12 Locomotion assay	35
2.13 Western blot analysis	36
2.13.1 Protein extraction	36
2.13.2 Protein quantification and sodium dodecyl sulfate- Polyacrylamide gel electrophoresis (SDS-PAGE)	36
2.13.3 Immunoblotting	37
2.13.4 Stripping	38
2.13.5 Semi-quantitative analysis of Western blot results	38
2.14 Microscopy and imaging	39
2.15 Statistical analysis	39

Chapter 3 Construction of TH-GFP plasmid	40
3.1 Introduction	40
3.2 Objectives	42
3.3 Materials and Methods	43
3.3.1 Primers design of TH1 sequence	43
3.3.2 PCR assay	43
3.3.3 Electrophoresis	43
3.3.4 Sequencing	44
3.3.5 Preparation of plasmid DNA	44
3.3.6 Bacterial culture	45
3.3.7 Microinjection	45
3.3.8 Whole-mount antibody immunofluorescence	45
3.3.9 6-OHDA treatment	46
3.4 Results	47
3.4.1 Cloning of TH1 sequence	47
3.4.2 Construction of TH-GFP plasmid	47
3.4.3 Production of transgenic TH-GFP zebrafish	49
3.4.4 6-OHDA reduced TH expression	51
3.4.5 Survival differences of transgenic and non-transgenic zebrafish	51
3.5 Discussion	53
3.5.1 Cloning of TH1 sequence	53
3.5.2 Autofluorescence of zebrafish	54
3.5.3 TH-GFP expression in transgenic zebrafish	54
3.5.4 6-OHDA treatment confirmed the successful transfection of TH-GFP plasmid	56
3.5.5 Survival difference of transgenic and non-transgenic zebrafish	56
3.5.6 Transfection efficiency	57
3.6 Conclusion	80
 Chapter 4 Acute nicotine treatments in larval zebrafish	 81
4.1 Introduction	81
4.2 Objectives	83
4.3 Materials and Methods	84
4.3.1 Nicotine treatment	84
4.3.2 Locomotion assay	84
4.3.3 Western blot analysis	85
4.4 Results	86
4.4.1 Acute nicotine treatments induced aberrant swimming pattern	86

4.4.2 Acute nicotine treatments enhanced locomotion activity dose dependently	87
4.4.3 Acute nicotine treatments increased TH protein level dose dependently	88
4.4.4 Acute nicotine treatments increased TH-GFP expression in transgenic zebrafish dose dependently	88
4.5 Discussion	90
4.5.1 Choice of 5dpf zebrafish in locomotion assay	90
4.5.2 Acute nicotine treatments induced aberrant swimming pattern	90
4.5.3 Enhancement of locomotion activity by nicotine is dose dependent	92
4.5.4 Increase of TH protein level by nicotine is dose dependent	93
4.5.5 Increase of TH-GFP expression in transgenic zebrafish by nicotine is dose dependent	94
4.6 Conclusion	106
 Chapter 5 Acute ketamine treatments in larval zebrafish	 107
5.1 Introduction	107
5.2 Objectives	109
5.3 Materials and Methods	110
5.3.1 Ketamine treatment	110
5.3.2 Locomotion assay	110
5.3.3 Western blot analysis	111
5.4 Results	112
5.4.1 Acute ketamine treatments induced aberrant swimming pattern	112
5.4.2 Acute ketamine treatments changed locomotion activity	113
5.4.3 Acute ketamine treatments changed TH protein level	114
5.4.4 Acute ketamine treatments changed TH-GFP expression in transgenic zebrafish	114
5.5 Discussion	116
5.5.1 Acute ketamine treatments induced aberrant swimming pattern	116
5.5.2 Acute ketamine treatments changed locomotion activity	117
5.5.3 Acute ketamine treatments changed TH protein level	118
5.5.4 Acute ketamine treatments changed TH-GFP expression in transgenic zebrafish	119
5.6 Conclusion	131
