# Abstract

The study on inverse problems has played a pivotal role to various disciplines of science, technology, engineering and mathematics, including x-ray, ultrasound, magnetoencephalography, geophysical exploration, radar and criminal investigations. In the view of their novel promising applications, we investigate the potentials for several inverse scattering approaches and applications.

In our first topic, we are concerned a new approach for generating two-dimensional or three-dimensional geometric body shapes by inputting characteristic parameters of a specific geometric body. Our study is combined with the machine learning approach and the inverse scattering techniques on the theory of wave propagation associated with the Helmholtz equation. We first introduce the important notations of the shape space and then the shape generators via inverse source scattering associated with Helmholtz equation for the generation of the geometric body shapes. Then, we develop a machine learning scheme for the generation of geometric body shape by using the setup of the shape generators and the shape space. That is, the input-output pairs of the training data set are formulated by the characteristic set and the shape generators. The predicted output, the new shape generator is computed by the training dataset and learning model. We finally reconstruct the new shape generator to geometric body shape by a stable multiple-frequency Fourier method and numerically simulate some examples.

In our second topic, we are concerned with the three-dimensional elastic scattering coefficients (ESC) and the enhancement of the elastic near cloaking. We establish the ESC of arbitrary three-dimensional objects and some of their properties using the elements of the elastic layer potential theory and multipolar expansions. We then construct the enhanced near elastic cloaking at a fixed frequency by using the ESC-vanishing-structures and transformation-elastodynamics. We also study some numerical examples on three-dimensional ESC.

In our third topic, we are concerned with the inverse problem of identifying magnetic anomalies with varying parameters beneath the Earth using geomagnetic monitoring. We study the information about the anomalies as well as their variations by

the observations of the change in Earth's magnetic field, so called the secular variation. We rigorously establish the unique recovery results for this magnetic anomaly detection problem. We show that one can uniquely recover the locations, the variation parameters including the growth or decaying rates as well as their material parameters of the anomalies.

# Table of Contents

Declaration	i
Abstract	ii
Acknowledgements	iv
Table of Contents	vi
List of Figures	vii
List of Tables	viii
List of Algorithms	ix
List of My Publications	x
Chapter 1 Introduction	1
1.1 Inverse Problems . . . . .	1
1.2 Three Topics to be Explored . . . . .	3
1.2.1 An Inverse Scattering Approach for Geometric Body Generation	4
1.2.2 Enhanced Elastic Cloaking in Three Dimensional . . . . .	6
1.2.3 Magnetic Anomaly Detection Using Geomagnetic Monitoring .	9
1.3 Structure of the Thesis . . . . .	11
Chapter 2 An Inverse Scattering Approach for Geometric Body Generation: a Machine Learning Perspective	12
2.1 Introduction . . . . .	13
2.2 Preliminary Knowledge on Shape Manifold Theory . . . . .	15

2.3	Shape Generators via Inverse Source Scattering . . . . .	17
2.4	Mathematical Setup for the Geometric Body Generation . . . . .	19
2.5	A Scheme for the Generation of Geometric Body Shapes . . . . .	22
2.5.1	Preliminary Knowledge on the Cubic B-Spline . . . . .	22
2.5.2	Uniform B-Spline . . . . .	26
2.5.3	Natural Spline . . . . .	28
2.5.4	Prediction on Shape Generator . . . . .	28
2.5.5	Reconstruction . . . . .	28
2.5.6	Summary . . . . .	33
2.6	Numerical Examples . . . . .	33
2.6.1	Kite Shaped Experiments . . . . .	35
2.6.2	Rounded Triangle and Apple Shaped Experiments . . . . .	35
2.6.3	Rectangular Solid Experiments . . . . .	37
2.6.4	Body Experiments . . . . .	38
2.7	Concluding Remarks . . . . .	39
Chapter 3 The Enhancement of the Elastic Near Cloaking in Three-Dimensional		43
3.1	Introduction . . . . .	44
3.2	Layer Potential Theory for Lamé System . . . . .	44
3.2.1	Preliminaries and Notation . . . . .	45
3.2.2	Integral Representation of Scattered Field . . . . .	48
3.3	Three-Dimensional Elastic Scattering Coefficients . . . . .	51
3.3.1	Multipolar Expansions of Elastic Fields . . . . .	51
3.3.2	Scattering Coefficients of Elastic Inclusions . . . . .	54
3.3.3	Far-Field Amplitudes and Elastic Scattering Coefficients . . . . .	57
3.4	Three-Dimensional ESC-Vanishing Structures . . . . .	59
3.4.1	Design of ESC-Vanishing Structure . . . . .	59
3.4.2	Determination of Coefficients $a_\ell^j$ and $b_\ell^j$ . . . . .	62
3.4.3	Constitutive Equations for Material Parameters . . . . .	65
3.4.4	Numerical Examples . . . . .	68
3.5	Nearly ESC-Vanishing Structures and Enhancement of the Near-Cloaking	71
3.5.1	Low-Frequency Behavior of ESC . . . . .	71

3.5.2	Enhancement of Near-Cloaking in Elasticity . . . . .	74
3.6	Concluding Remarks . . . . .	77
Chapter 4	Varying Magnetic Anomaly Detection Using Geomagnetic Monitoring	78
4.1	Introduction . . . . .	78
4.1.1	Mathematical Setup . . . . .	78
4.1.2	Physical Background and Connection to Existing Results . . .	82
4.2	Asymptotic Expansions of the Geomagnetic Fields . . . . .	85
4.2.1	Layer Potentials . . . . .	86
4.2.2	Low-Frequency Asymptotic Expansions of the Magnetic Fields	88
4.2.3	Asymptotic Expansions of $\mathbf{H}_s$ with Respect to the Anomaly Size	95
4.3	Further Asymptotic Analysis . . . . .	105
4.4	Unique Recovery Results for Magnetic Anomaly Detections . . . . .	113
4.4.1	Uniqueness in Recovering a Single Anomaly . . . . .	115
4.4.2	Uniqueness in Recovering Multiple Anomalies . . . . .	118
4.5	Concluding Remark . . . . .	120
Chapter 5	Future Works	121
5.1	A Mathematical Study on Inverse Problems Associated with the Seismo-Electromagnetic System . . . . .	121
5.1.1	Objectives . . . . .	122
5.1.2	Background of Research . . . . .	123
5.1.3	Research Plan and Methodology . . . . .	126
Chapter 6	Appendix	131
6.1	Proof of Theorem 3.3.3 . . . . .	131
6.2	Surface Tractions of Multipole Elastic Fields . . . . .	135
6.3	Expressions of Sub-Matrices . . . . .	136
6.4	Proof of Lemma 3.5.1 . . . . .	137

# List of Figures

1.1	The above two figures represent the wave trajectories for different cases. (a) Without a cloak. (b) With a cloak. . . . .	7
1.2	Illustration for invisibility: the cloaking device. . . . .	8
1.3	Mathematical model of geomagnetic anomalies monitoring. . . . .	10
2.1	The procedure of the geometric body shape generation. (1)Prepare training set; (2)Construct learning model; (3)Infer the new shape-generator of new shape by inputting characteristic values. (4)Reconstruct the shape from new shape-generator. . . . .	14
2.2	Contour plots of reconstructed kite shape with different scale factors $(\beta_1, \beta_2)$ : (a) (0.93, 1.76), (b) (1.58, 0.87), (c) (0.95, 0.95), (d) (1.65, 1.65). . . . .	36
2.3	Contour plots of reconstructed mixed shape with different scale factors $(\beta_1, \beta_2)$ : (a) (1.13, 1.13), (b) (1.94, 0.53), (c) (1.88, 0.94), (d) (1.96, 1.47). . . . .	37
2.4	Isosurface plots of rectangular solid with different height, width and length, where the isosurface value is 1. The sets of height, width and length are as follows: (a) (1.9, 1.2, 1.4), (b) (1.2, 1.5, 1.8), (c) (1.6, 1.8, 1.3), (d) (1.8, 1.8, 1.8). . . . .	38
2.5	Isosurface plots of some training body data. Relative weight: the left column is 60%; the center column is 100%, the right column is 140%; height: the top row is 1.50m, the center row is 1.70m, the bottom row is 1.90m. . . . .	40

2.6	The relative weight is 130%, the height is 1.55m. (a) Exact body, (b) reconstruction body. . . . .	41
2.7	The relative weight is 110%, the height is 1.85m. (a) Exact body, (b) reconstruction body. . . . .	41
3.1	Illustration for scattering vanishing: the multi-layered cloaking device before transformation. Different elastic medium parameters ( $\lambda_j, \mu_j, \rho_j$ ) are in different regions $A_j, j = 0, 1, \dots, l + 1$ . . . . .	60
3.2	The top row, center row and bottom row denote parameters $\lambda, \mu$ and $\rho$ , respectively. The left column denotes the case with no layer, the center column denotes the case with 1 cloaking layer, and the right column denotes the case with 2 cloaking layers. . . . .	69
3.3	Scatter plots of the elastic scattering coefficients ( $W_n^{LL}$ and $W_n^{NL}$ ) by using the parameters in Figure 3.2. . . . .	70
3.4	Scatter plots of the scattering coefficients ( $W_n^{LN}$ and $W_n^{NN}$ ) by using different parameters. . . . .	70
3.5	Scatter plots of the elastic scattering coefficient $W_n^{MM}$ by using different parameters. . . . .	71
5.1	Schematic illustrations of different cases. (a)On identifying the elastic source using the geomagnetic monitoring. (b)On identifying the electromagnetic anomalies using the geomagnetic monitoring. (c)On identifying the motion trajectory of the dynamic elastic source using the geomagnetic monitoring. (4)On identifying the motion trajectory of the dynamic electro-magnetic anomaly using the geomagnetic monitoring. . . . .	130

# List of Tables

- 2.1 Training dataset with the given characteristic grids ( $\lambda^{(height)}, \lambda^{(weight)}$ ). 24
